

Vision for a Healthy Lake

Unhealthy Lake

- Poor water clarity
- High nutrient levels (phosphorus)
- Low oxygen levels in deep water
- Frequent cyanobacteria blooms
- Increased presence of invasive plants
- Poor habitat for native plants and animals
- Low biodiversity
- Reduced recreational opportunities

Healthy Lake

- Improved water clarity
- Moderate nutrient levels (phosphorus)
- High oxygen levels in deep water
- Infrequent cyanobacteria blooms
- Improved habitat for native plants and animals
- Increased biodiversity
- Increased recreational opportunities

Poor water quality in Elk/Beaver Lake has had significant impacts on the health of the ecosystem and reduced recreation opportunities at the lake. Through coordinated efforts, we are working to improve water quality and support a healthy and diverse ecosystem, with improved recreation opportunities.
